

Bug Hunting with Git-Bisect

...

How to use git-bisect to pinpoint the cause of a bug

What is Git-Bisect?

1. Mark a commit as broken.
2. Mark an older commit as working.
3. You should be able to quickly test if a checked-out commit is broken or not.
4. Git searches through all commits in between to find the commit that broke something.

Let's See an Example!

Summary

```
$ git bisect start
```

```
$ git bisect bad
```

```
$ git bisect good v1.0
```

```
$ git bisect <good | bad>
```

```
$ git bisect reset
```

Thanks for Listening!
